Module-3

Session-1:

5.Compare your procedural C version and OOP TaskList version: List 3 problems you faced in the C version that were solved by using classes and methods in the OOP version.

No.	C Language	OOP in C++
1	Data is stored in global arrays.	Data is stored inside objects.
2	Data and functions are separate.	Data and methods are combined in a class.
3	Managing many tasks becomes difficult.	Classes and objects make task management easier.

Session-6:

5.Explain in your own words the difference between encapsulation and abstraction, using examples from any social media app you use daily (like Instagram or WhatsApp).

Sr. No.	**Encapsulation**	**Abstraction**
1.	Encapsulation is the process of wrapping data and methods into a single unit called a class.	Abstraction is the process of hiding implementation details and showing only essential features.
2.	It focuses on data protection and controlled access.	It focuses on hiding unnecessary implementation details.
3.	It can be achieved using access specifiers such as private, protected, and public.	It can be achieved using abstract classes and pure virtual functions in C++.
4.	It protects data from direct access from outside the class.	It reduces complexity by showing only the required functionality.
5.	Example: Keeping a user's phone number private and accessing it through getter and setter methods.	Example: Sending a WhatsApp message using the Send button without knowing the internal process.
