

Module – 2

Session – 1:

1. Write a short paragraph in your own words defining what a 'program' is and give one real-life example from any app you use daily.

Answer:

A program is a set of instructions that tells a computer or mobile what to do. For example, in Paytm, a program helps us to enter the amount, make a payment, and show the payment status.

2. List three popular programming languages you have heard of, and for each, mention whether it is usually compiled, interpreted, or can be both.

Answer:

Programming Language	Type
Java	Compiled
Python	Interpreted
JavaScript	Interpreted

3. Draw a flowchart for the process of booking a movie ticket on BookMyShow, starting from opening the app to receiving the booking confirmation.

Answer:

4. Write down the steps (as an algorithm, using simple numbered instructions) for ordering food on Swiggy — from opening the app to completing payment.

Answer:

1. Start.
 2. Open the Swiggy app.
 3. Select the location.
 4. Search for a restaurant.
 5. Select the food items.
 6. Add the items to the cart.
 7. Check the order details.
 8. Enter the delivery address.
 9. Select a payment method.
 10. Make the payment.
 11. Get the order confirmation.
 12. End.
-

Session – 2:

1. Install GCC on your computer and verify the installation by running `gcc --version` in your terminal or command prompt.

Answer:

I checked GCC installation by running `gcc --version` in Command Prompt. It showed GCC 6.3.0, so GCC is installed and working properly.

- 2. Open VS Code or DevC++ and create a new file named hello.c. Write a C program that prints 'Hello, Instagram World!' to the console.**

Answer:

File name => hello.c

```
#include<stdio.h>

int main()
{
    printf("Hello, Instagram World!");
    return 0;
}
```

Output:

Hello, Instagram World!

- 3. Identify and label the header, main function, and return statement in your hello.c program using comments.**

```
#include<stdio.h> // Header
int main() // Main function
{
    printf("Hello, Instagram World!");
    return 0; // Return statement
}
```

- 4. Compile your hello.c file using the GCC command line (gcc hello.c -o hello) and run the output file to display the message in your terminal.

Hint: On Windows, the output file will be hello.exe; on Linux/Mac, it will be hello.**

Answer:

First, open Command Prompt in the folder where hello.c is saved.

Compile the program using:

```
gcc hello.c -o hello
```

Then run the program using:

```
hello.exe
```

Output:

```
Hello, Instagram World!
```

Session – 3:

- 4. Identify and correct the invalid variable names from this list: 1stPlayer, player_age, \$score, total-marks, userName. Apply standard variable naming rules for your programming language.**

1stPlayer → Invalid Correct name: firstPlayer

player_age → player_age (Valid)

\$score → Invalid Correct : score

total-marks → Invalid Correct : total_marks

userName → userName (Valid)
